- Population census is expensive using conventional methods
 - 180 millions euros in France ([officials, 1999](#))
- How Satellites images could explain human density ?
- How to transform satellite images to best explain human density ?

1 Presentation

- Landsat-8 images are georeferenced which means each pixel has (x,y) meter coordinates in a certain Projection Coordinates System (ex : *UTM*, *Lambert 93*, *Web Mercator*,...)

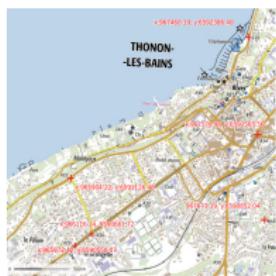

Landsat-8 Eastern-France image
path=196, row=028
georeferenced in *UTM* system
(image containing city
Thonon-les-Bains)

UTM corner coordinates (meters)

- upper-left (486202.777, 5958940.580)
- lower-left (486202.777, 5610657.403)
- upper-right (828135.467, 5958940.580)
- lower-right (828135.467, 5610657.403)
- center (657169.122, 5784798.992)

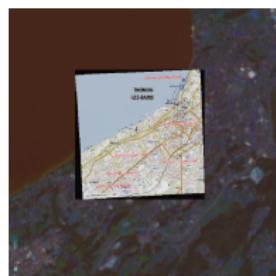

- Landsat-8 georeferencement can be checked comparing with another georeferenced source like *IGN* using a *SIG* (open source *QGIS*).

IGN map georeferenced in *Lambert 93* system

Then IGN image is tranformed to be georeferenced in *UTM* system

Superposition of IGN map and Landsat-8 image both georeferenced in *UTM* system

- Query images from *U.S geological Survey* website with criterias :
 - cloud covering $\leq 20\%$
 - day acquisition
 - between May, 2013 and September, 2013

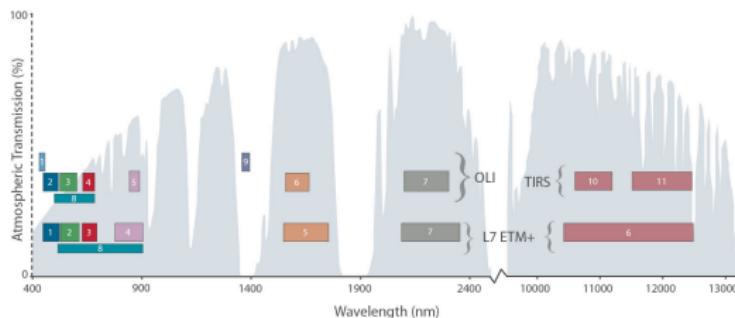

Polygon selection on *USGS* website

70 resulting datasets georeferenced in
Web Mercator system

- Landsat-8 dataset is composed of
 - 11 bands (OLI/TRS sensors) + 1 quality band (cloudyness of each pixel)
 - Possible combination of bands to extract information (bands 4 and 5 for vegetation presence)

Landsat-8 bands (OLI/TIRS sensors)

- Categorize densities applying clustering (Otsu mutli-thresholding)

catégorie 1 : density between 0 and 500 habs/km^2
 catégorie 2 : density between 500 and 2000 habs/km^2
 catégorie 3 : density between 2000 and 5000 habs/km^2
 catégorie 4 : density between 5000 and 10000 habs/km^2
 catégorie 5 : density between 10000 and 13000 habs/km^2
 catégorie 6 : density greater than 13000 habs/km^2

city	latitude (degrees)	longitude (degrees)	surface (km^2)	density (habs/km^2)	density (category)
Ozan	46.391534	4.915265	6.6	98.3	1
Cormoranche-sur-saone	46.240532	4.830863	9	118.9	1

- Compute Normalized Difference Vegetation Indice using bands 4 (Red) and 5 (Near-Infra-Red) for each dataset :

$$NDVI = \frac{NIR - R}{NIR + R}$$

- Values between -1 and 1
- ≤ 0 for water, snow and cloud
- ≤ 0.2 for ground without vegetation
- ≥ 0.2 for ground vegetation

RGB (Paris, May 2013)

NDVI (Paris, May 2013)

NDVI (1024 bins)-histogram

- Overcome imbalanced data by oversampling minority class c_i , using SMOTE technique (Synthetic Minority Oversampling TЕchnique) with a factor n_1/n_i

Let's $x_i, x_{i1}, x_{i2}, x_{i3}$ and x_{i4} be points of minority class i and y_{jk} the points of majority class j , choose each new sample r_j for class i that maximizes $\sum_{k=1}^{n_j} (y_{jk} - r_j)^2$

- Best cross-validation (stratified 3-folds) of 94.74% obtained for number of neighbours $k = 5$.

- Overcome imbalanced data by increasing regularization parameter C_i for minority classes $i : C_i = n/n_i$

$C = 1$ - bad classification

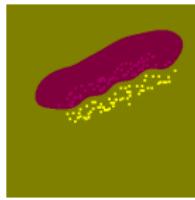

$C = 10$ - no overfitting

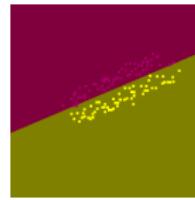

$C = 10^6$ - overfitting

- Best cross-validation (stratified 3-folds) of 84.07% obtained for $\gamma = 0.01$ (confident value to avoid overfitting).

$\gamma = 100$ - overfitting

$\gamma = 0.01$ - no overfitting

- Overcome imbalanced data by majoring error on minority class using weight : $w_i = \frac{n_1}{n_i}$.
- Best cross-validation (stratified 3-folds) of 90.46% obtained for :
 - One layer of 1200 neurons
 - Stochastic Gradient Descent learning rate of 0.001
 - Penalization of 0.001.
- Early stopping activation to avoid overfitting (i.e. stop iterative training when no more validation score improvment)

France density classification error ($y_{pred} - y_{true}$)

France cloudyness

- Green points shows that a lot of low densities (category 1) are predicted as high densities (categorie 5/6) (see Corsica).
- This can be related to cloudyness that provides zero values for NDVI like high densities does :

Silvareccio
 cloudyness :
 49.5%
 true : 1
 pred : 6
 error : 5

rgb

ndvi

Porri
 cloudyness :
 0.0%
 true : 1
 pred : 1
 error : 0

Youcef Kacer

Satellite images for human density prediction

- Training Area Under Curve

Mean AUC	
Classifier	France
Nearest Neighbors	1.00
Support Vector Machine (Gaussian)	0.96
Neural Network	0.98

- Testing Area Under Curve

Mean AUC			
Classifier	Switzerland	Belgium	The Netherlands
Nearest Neighbors	0.89	0.87	0.85
Support Vector Machine (Gaussian)	0.94	0.95	0.94
Neural Network	0.97	0.97	0.96

- Nearest Neighbors clearly overfitted (important gap between training and testing)
- Best Generalization for Neural Network

- practical improvement : Get higher dimensional features and train it using cluster-distributed features and Spark MLlib or Hadoop XGBoost.
- theoretical improvement : Overcome local cloudyness with a finer NDVI. For example, indice **GEMI**.

$$GEMI = \eta(1 - 0.25\eta) - \frac{R - 0.25}{1 - R}$$

$$\eta = \frac{2(NIR^2 - R^2) + 1.5NIR + 0.5R}{NIR + R}$$
